

Amphibians

Cheyenne Bottoms Wildlife Area is home to at least eight species of amphibians. More species probably occur at the Bottoms but have not yet been observed. Amphibians begin life as eggs deposited in water. They later metamorphose (change bodies) into tadpoles and then into adults. Adults are more terrestrial (land living) than tadpoles and eggs but are still dependent on water. Amphibians eat aquatic (water living) and terrestrial insects, tadpoles, fish, frogs, and toads. Amphibians also are important food items for wading birds, raptors, and some mammals, such as striped skunks and raccoons.

Turtles & Reptiles

Nineteen species of turtles and reptiles have been observed at Cheyenne Bottoms Wildlife Area. Because many species are secretive and difficult to observe, there may be several other species present at the Bottoms, as well. In general, turtles and reptiles are more terrestrial (land living) than amphibians. However, turtles are commonly found in water. Turtles, lizards, and some snakes, such as eastern racers and bullsnakes, lay eggs on land. Other snakes, such as garter snakes and water snakes, produce litters of live young. The diet of turtles and reptiles include aquatic plants, insects, crayfish, fish, amphibians, snakes, turtles, bird eggs, small birds, and small mammals. Some snakes may be important predators of ground nesting birds. Reptiles themselves are eaten by wading birds, raptors, and raccoons.
